Technical note	31

EXPLANATORY NOTES

Introduction

In February 1981 a survey, based on the monthly population survey, was conducted throughout Australia in order to obtain information about some aspects of the mobility of persons who had been employed at some time during the period February 1980 to February 1981, e.g. the number of different employers for whom employees had worked during the period or the number of different businesses in which employers and self-employed persons had been engaged.

2. A preliminary publication containing a summary of the more important results was published on 25 September 1981. Results of similar surveys, the first conducted in November 1972, were published in previous issues of this publication. For details of the changed reference period between the February 1981 survey and previous surveys, refer to paragraph 18.

3. The survey was based on a multi-stage area sample of private dwellings (about 22,500 houses, flats, etc.) and non-private dwellings (hotels, motels, etc.) and covered about one half of one per cent of the population of Australia. The information was obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers, the interviews being conducted during the two weeks beginning on Monday, 9 February 1981.

Scope

4. The survey included all persons aged fifteen years and over except:

- (a) members of the permanent defence forces;
- (b) certain diplomatic personnel of overseas governments, customarily excluded from census and estimated populations;
- (c) overseas visitors holidaying in Australia;
- (d) members of non-Australian defence forces (and their dependants) stationed in Australia; and
- (e) boarding school students, some patients in hospitals and sanatoria, or inmates of jails, reformatories, etc.

5. The estimates relate to the labour mobility during the period February 1980 to February 1981, of persons covered by the survey in February 1981. Because of emigration, deaths and other exits, not all persons with labour force experience during the period were covered. Labour mobility may relate to experience outside Australia.

Definitions

6. For this survey, each person was assigned to a labour force category for each week during the reference period on the basis of his *reported activity* (i.e. whether working, looking for work, etc.) during that week.

7. The *labour force* comprises all persons who, during any week, were employed or looking for work as defined in paragraphs 8 and 9.

8. *Employed persons*. Persons were classified as employed for those weeks they reported having either worked or being on paid leave. Periods of one week or more on strike or time off without pay were excluded.

9. Persons were classified as *looking for work* for those weeks they reported as being out of work and looking for a job. Taking active steps to find work and availability to start work are conditions which usually apply when defining such persons in labour force surveys. These conditions are not practicable, however, for a survey with a reference period of twelve months.

10. *Persons not in the labour force* are those who, during any week, were not employed or looking for work as defined in paragraphs 8 and 9.

11. For the purposes of the survey, a *job* was defined as:

- (a) employment as a wage or salary earner (or unpaid family helper) by a particular employer, in a particular locality; or
- (b) self-employment (with or without employees) in a particular locality.

12. *Locality*. In capital cities and major towns each suburb was considered to be a different locality; elsewhere, each town and each country area associated with a town constituted a separate locality.

13. A *change of job* may have involved a change of employer without a change of job location; a change of location without a change of employer; or a change in both employer and location. For example, the movement of an employer's operations to premises in a different location would entail a change of job for employees who moved to the new location. Promotion or transfer of an employee which involved a move to premises in a different location would also constitute a change of job. It should be noted, however, that for a person who worked at different sites for the same employer (for example, a construction worker), his base of operations (i.e. his employer's office, depot, yard, etc.) was considered to be his place of work.

14. A *change in industry* (Tables 23 to 25) was defined as a change at the three digit level 'ASIC group' classified according to the 1978 Australian Standard Industrial Classification (ASIC).

15. A *change in occupation* (Tables 23 to 25) was defined as a change at the three digit level 'occupation code' classified according to the 1976 Population Census Classification of Occupations.

16. The term *not married* comprises persons who at the time of the survey had never been married, were widowed or divorced.

17. *Main English-speaking countries* comprise the United Kingdom, Ireland, Canada, the United States of America, South Africa and New Zealand.

Discontinuity in the series

18. The estimates in this publication are not strictly comparable with those obtained from previous labour mobility surveys as for those surveys the reference period was the preceding calendar year. The February 1981 survey reference period was from the beginning of February 1980 to the end of survey week. For this reason the reference period could extend to 54 weeks.

19. Although the reference period could extend to 54 weeks, persons who reported that they had worked for 52 weeks during the period were asked about their labour force activity at the time of the survey, but not for the remaining weeks of the period. If these persons were unemployed or not in the labour force at the time of the survey, they were classified as having been employed for 52 weeks and unemployed, or not in the labour force, respectively, for the balance of the period, i.e. 1 or 2 weeks.

20. *Reason for leaving a job* was only asked of persons who stated that they changed jobs (as defined in paragraph 13 above). Thus this survey differs from previous surveys where reason for leaving a job was asked for all persons who left a job during the period. It is estimated that there were 544,600 persons who left a job but did not change jobs during the period February 1980 to February 1981 and were thus not asked their reason for leaving that job.

21. For persons who changed jobs during the period, data collected on *previous job* in the 1980 and prior surveys is now collected in respect of *first job* held in the period.

Reliability of the estimates

22. Estimates in this publication are subject to two sources of error:

- (a) *sampling error*: since the estimates are based on information obtained from occupants of a sample of dwellings, they may differ from the figures that would have been produced if all dwellings had been included in the survey. More information on this topic is given in the Technical note.

- (b) *non-sampling error*: inaccuracies may occur because of imperfections in reporting by interviewers and respondents and errors made in the coding and processing of data. These inaccuracies may occur in any enumeration, whether it be a full count or only a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

Related publications

23. Other ABS publications which may be of interest include:

The Labour Force, Australia (6203.0)—issued monthly

Labour Force Experience During the Period February 1980 to February 1981, Australia (6206.0)

Persons Not in the Labour Force, Australia, September 1981 (6220.0)

Persons Looking for Work, Australia, June 1981 (6222.0)

24. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

Symbols and other usages

- * subject to sampling variability too high for most practical uses. See paragraph 22 above.
- .. not applicable
- n.a. not available
- n.e.c. not elsewhere classified

25. Because figures have been rounded, discrepancies may occur between sums of the component items and totals.

(a) Comprises employers, self-employed persons and unpaid family helpers.

TECHNICAL NOTE

Estimation procedure

The estimates are derived from the population survey by use of a ratio estimation procedure which ensures that the estimates conform to an independently estimated distribution of the population for each capital city and remainder of State by age and sex, rather than to the corresponding distribution within the sample itself.

Reliability of the estimates

2. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings, they are subject to sampling variability; that is, they may differ from the figures that would have been produced if all dwellings had been included in the survey. One measure of the likely difference is given by the *standard error*, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included, and about nineteen chances in twenty that the difference will be less than two standard errors. Another measure of the likely difference is the *relative standard error*, which is obtained by expressing the standard error as a percentage of the estimate.

3. Space does not allow for the separate indication of the standard errors of all estimates in this publication. A table of standard errors for general application is given on the following page. Since they are averages based on calculations for a limited number of past surveys over a wide range of labour force characteristics, these figures will not give a precise measure of the standard error of a particular estimate but they will provide an indication of its magnitude.

4. An example of the calculation and the use of standard errors in relation to estimates of persons is as follows. Table 1 shows the estimated number of males in Australia over the age of 15 years who were out of the labour force for the whole period is 902,100. Since this estimate is between 500,000 and 1,000,000 in the standard error table, the standard error for Australia will be between 8,250 and 10,400 and can be approximated as 10,000 (rounded to the nearest 100). Therefore, there are about two chances in three that the value that would have been produced if all dwellings had been included in the survey will fall in the range 892,100 to 912,100 and about nineteen chances in twenty that the value will fall within the range 882,100 to 922,100. This example is illustrated in the following diagram.

5. As can be seen from the standard error table, *the smaller the estimate the higher is the relative standard error*. Very small estimates are thus subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In the tables in this publication, estimates less than the lowest levels shown in the standard error table have not been published. Although figures for these small components can in some cases be derived by subtraction, they should not be regarded as reliable.

6. Proportions and percentages formed from the ratio of two estimates are also subject to sampling error. The size of the error depends on the accuracy of both the numerator and the denominator. The formula for the relative standard error (RSE) of a proportion is given below:

$$RSE (x/y) = \sqrt{[RSE (x)]^2 + [RSE (y)]^2}$$

7. Considering the example from paragraph 4 above, the 902,100 males represent 26.3 per cent of the 3,436,500 persons who were out of the labour force for the whole of the period. The standard error of 3,436,500 is approximately 14,900 so the relative standard error is 1.1 per cent. The relative standard error for 902,100 is 1.1 per cent. Applying the above formula, the relative standard error of 26.3 per cent is $\sqrt{(1.1)^2 + (0.4)^2}$ or 1.0 per cent, giving a standard error of about 0.3. Therefore, there are about two chances in three that the proportion of males who were out of the labour force for the whole of the period is between 26.0 per cent and 26.6 per cent and nineteen chances in twenty the proportion is within the range 25.7 per cent to 26.9 per cent.

8. Published figures may also be used to estimate the difference between two survey estimates (of numbers or percentages). Such a figure is itself an estimate and is therefore subject to sampling error. The sampling error of the difference between two estimates depends on their standard errors and the relationship (correlation) between them. An approximate standard error (SE) of the difference between two estimates (x-y) may be calculated by the following formula:

$$SE (x-y) = \sqrt{[SE(x)]^2 + [SE(y)]^2}$$

While this formula will only be exact for differences between separate and uncorrelated characteristics or sub-populations it is expected to provide a good approximation for all differences likely to be of interest in this publication.

9. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by interviewers and respondents and errors made in the coding and processing of data. Inaccuracies of this kind are referred to as the *non-sampling error*, and they may occur in any enumeration, whether it be a full count or only a sample.
